

1 [A] Mermaid Diagram Syntax

Mermaid's syntax is used to create diagrams. `syntax`, together with `deployment` and `configuration` constitute the whole of mermaid

Diagrams examples can be found in the Mermaid Live Editor

1.1 Syntax Structure

- All `diagrams definitions` begin with a declaration of `diagram type` -> *Notify the parser which kind of diagram to generate*
- Followed by the `definitions` of the diagram and its content

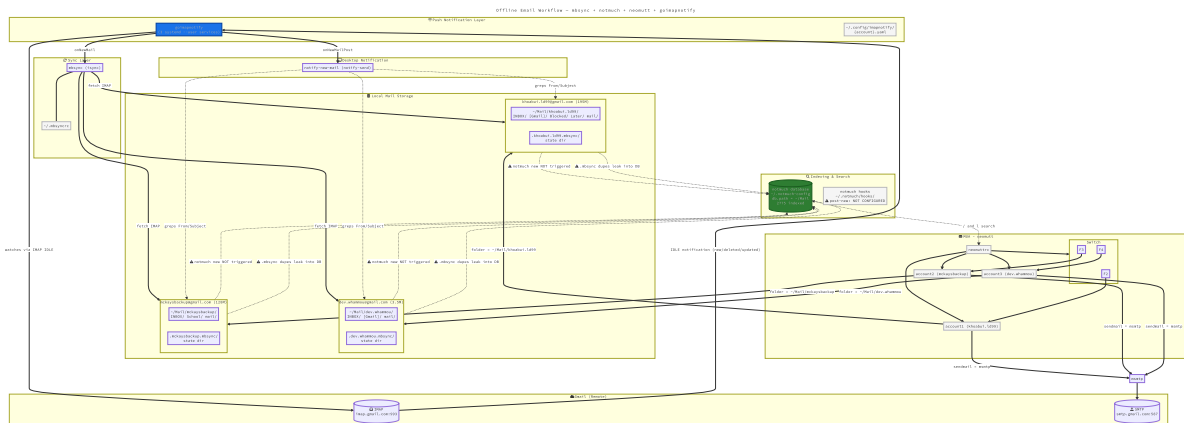

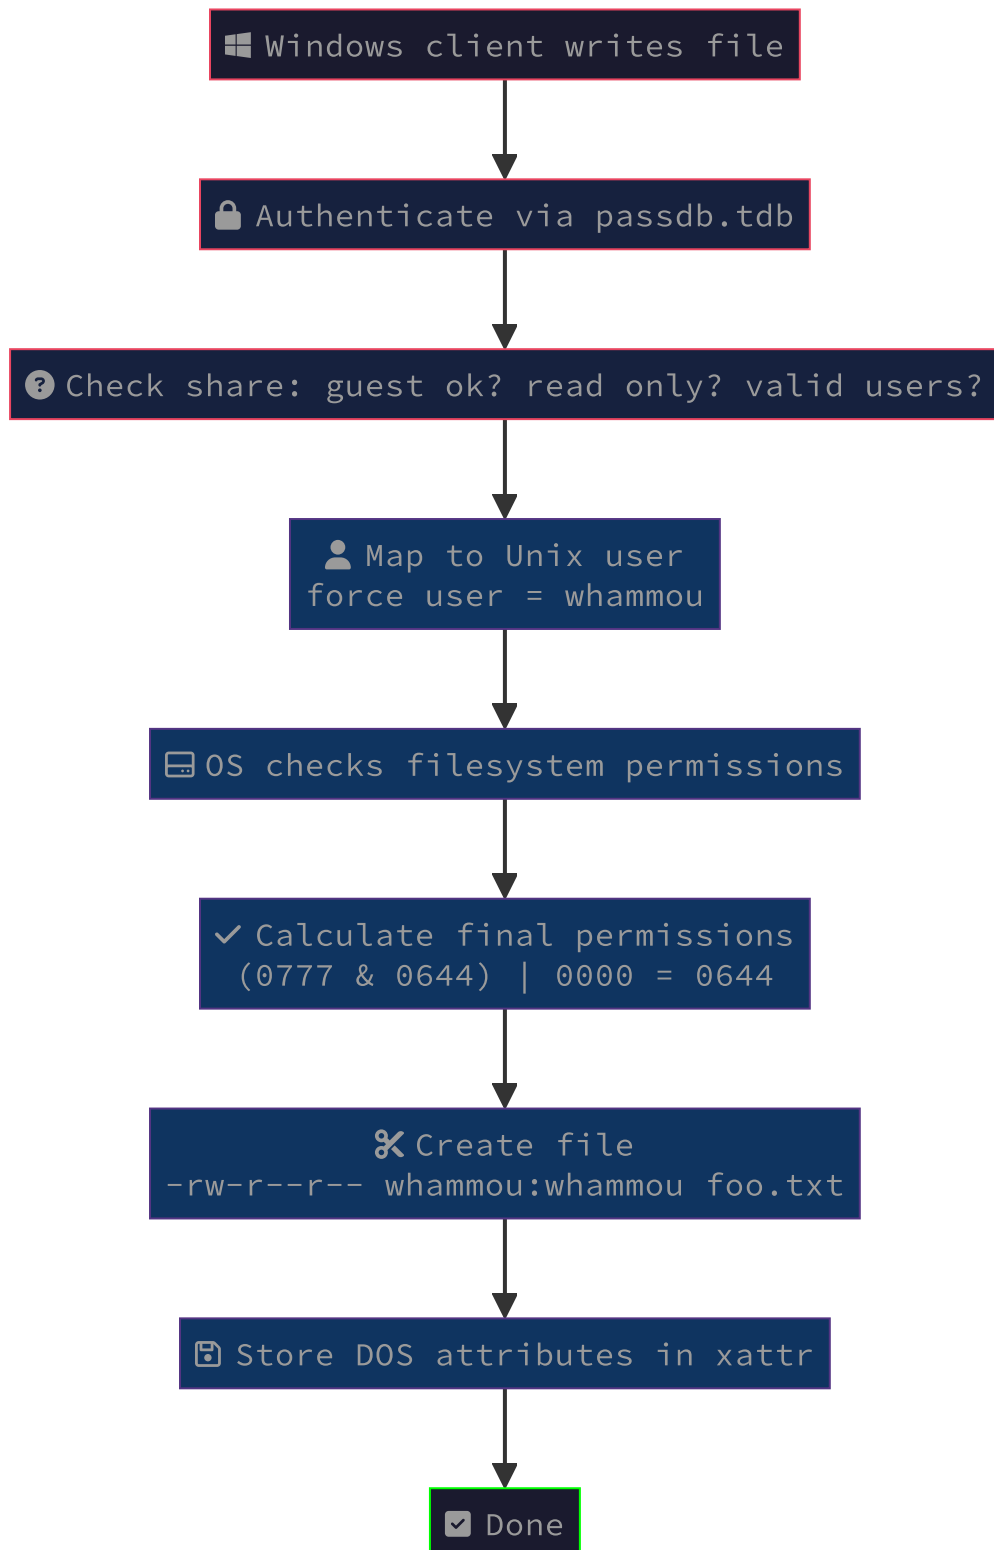

The only exception to this is a Frontmatter configuration

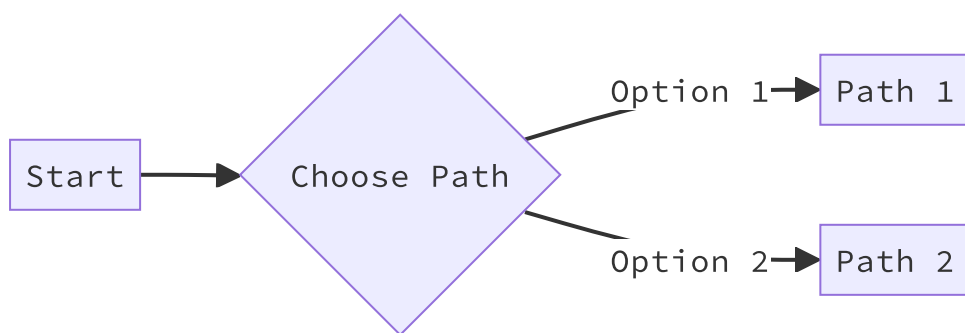

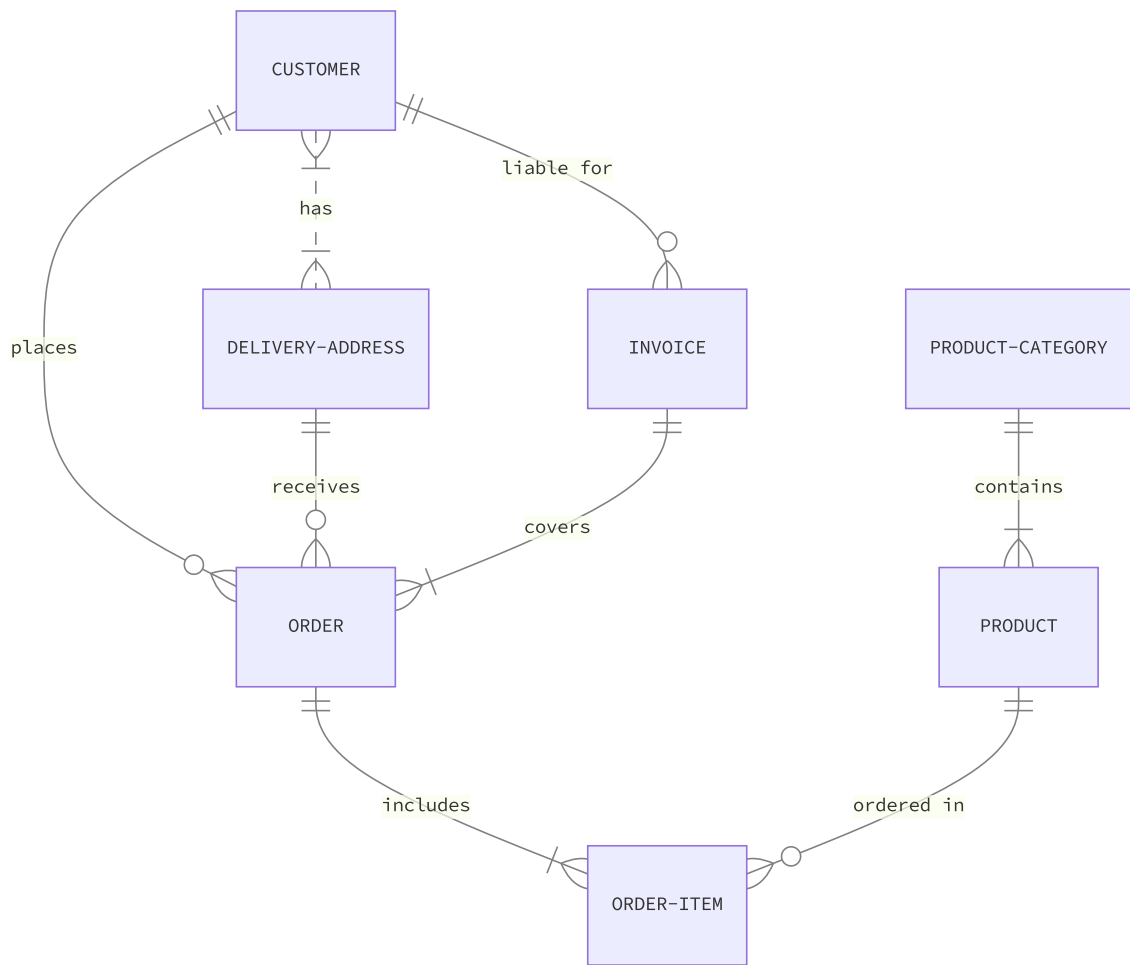

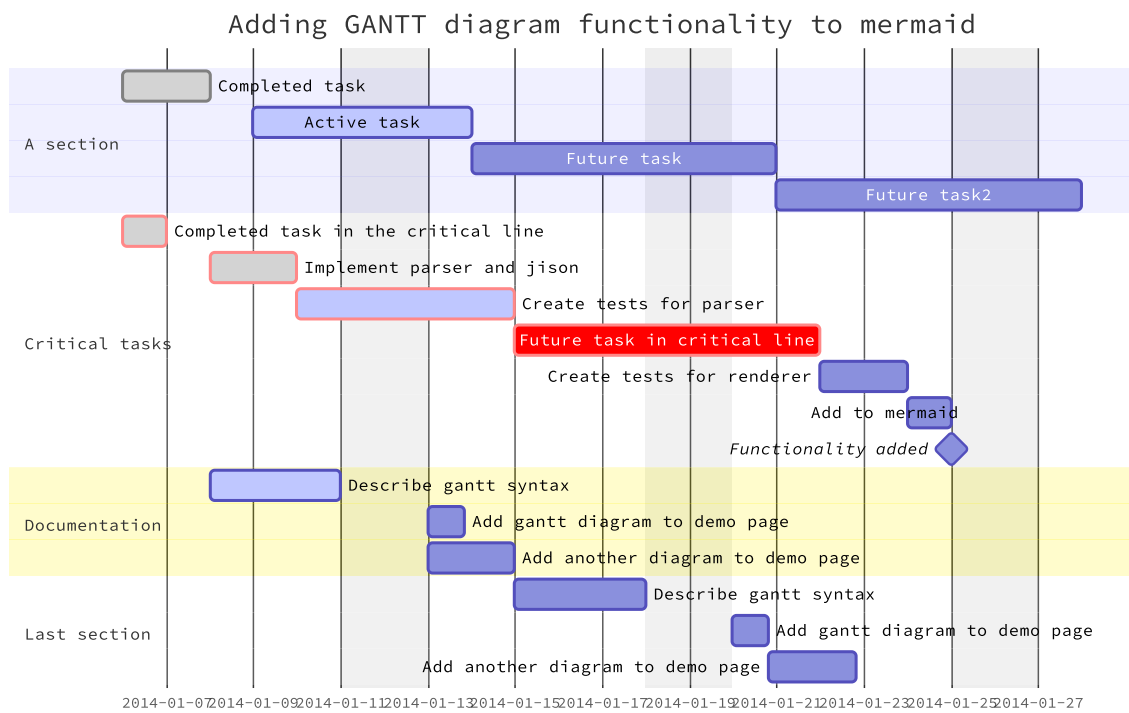

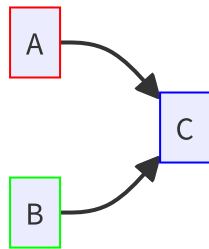

Unknown words and misspellings will break a diagram, while parameters silently fail.

Example: The code below is for an Entity Relationship Diagram, specified by the `erDiagram` declarations. What follows is the definition of different `Entities` represented in it

1.1.1 Flowcharts Diagrams

Flowcharts are composed of **nodes** (geometric shapes) and **edges** (arrow and lines). The mermaid code defines how nodes and edges are made and accommodates different arrow types

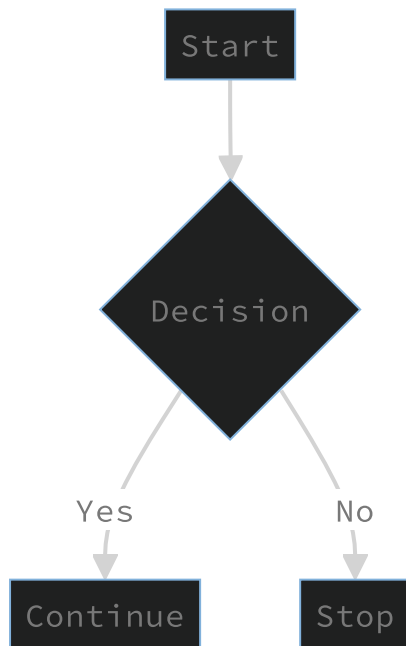

Using the word "end" (in all lowercase) in a Flowchart node will break the flowchart. To workaround use the entire word of any of the letters (e.g., "End" or "END")

If using the letter "o" or "x" as the first letter in a connecting flowchart, add a space before the letter or capitalize the letter (e.g.g, "dev— ops", "dev—Ops").

Typing "A—oB" will create a circle node.

Typing "A—xB" will create a cross node

1. Default Node

Node

Instead of using `flowchart` one can also use `graph`

2. A Node With Text

It is also possible to set text in the box that differs from the id. If this is done several times, it is the last text found for the node that will be used. Also if define edges for the node later, you can omit text definitions. The one previously defined will be used when rendering the box

Use `"` to enclose the unicode text

Node with Text

This is the rendered text in the box

1.2 Diagram Breaking

One should beware that the use of some words or symbols that can break diagrams. These words or symbols are few and often only effect specific types of diagram.

Diagram Breakers	Reason	Solution
comments	N A	N A
%%(")%%	Similar to Directive confuses the renderer	In comments using %%, avoid using "{}"
flow-charts	N A	N A
'end'	The word "End" can cause flowcharts and Sequence diagrams to break	wrap them in quotation marks to prevent breakage
Nodes inside Nodes	Mermaid gets confused with nested shapes	wrap them quotation marks to prevent breaking

1.3 Frontmatter of Diagram Code
